Background	cell division cycle 37(CDC37) Homo sapiens The protein encoded by this gene is highly similar to Cdc 37, a cell division cycle control protein of <i>Sacchromyces cerevisiae</i> . This protein is a molecular chaperone with specific function in cell signal transduction. It has been shown to form complex with Hsp90 and a variety of protein kinases including CDK4, CDK6, SRC, RAF-1, MOK, as well as eIF2 alpha kinases. It is thought to play a critical role in directing Hsp90 to its target kinases. [provided by RefSeq, Jul 2008],
