Description	EIF2AK3 phosphorylates the alpha subunit of eukaryotic translation-initiation factor 2 (EIF2) leading to its inactivation and a rapid reduction of translational initiation and repression of global protein synthesis. EIF2AK3 is a type I membrane protein located in the endoplasmic reticulum (ER), where it is induced by ER stress caused by malformed proteins . EIF2AK3 plays a major role in the ability of cells to adapt to ER stress and is also involved in an integrated adaptive response to hypoxic stress in HeLa cells . EIF2AK3 functions in iron homeostasis and may play a role in hemolytic and inflammatory anemia.
Functions	The specific activity of EIF2K3 was determined to be 18 nmol /min/mg as per activity assay protocol.
