Description	Protein kinase Cmu (PKC?) is a member of the protein kinase C (PKC) family that differs from the other PKC isoenzymes in structural and enzymatic properties. PKC? is a ubiquitous in nature with the highest expression in the thymus, lung and peripheral blood mononuclear cells . PKC? forms a complex in vivo with a phosphatidylinositol 4-kinase and a phosphatidylinositol-4-phosphate 5-kinase. A region of PKC? between the amino-terminal transmembrane domain and the pleckstrin homology domain is shown to be involved in the association with the lipid kinases .?
Functions	The specific activity of PKC? was determined to be 640 nmol /min/mg as per activity assay protoco
